## Overview

| Project | |
|---|---|
| Track | Track 1: Autonomous Agents (primary). Track 2: Dashboards & Interfaces (secondary). |
| Problem | AI trading agents hand over a verdict without showing which data they used, whether a data source failed, or whether the call survives a hard question. Traders cannot judge, challenge or share the reasoning. |
| Solution | A bull agent and a bear agent argue a token using only live evidence from RYO's research tools. A judge rules long, short or stand aside. The user can cross-examine: RYO tools are re-run live, the agents answer and the call is recorded before and after in a shareable receipt. |
| Key Features | Evidence-linked claims checked against tool data; unsupported claims struck out and shown; cross-examination with a before/after diff; practice entry, stop and target computed in code from price and ATR(14); Case Board ranked by what changed; failed tools shown as unavailable, never filled in. |

| | |
|---|---|
| Target Users | Crypto traders, analysts and communities who want AI market calls they can inspect, challenge and share. |
| Scope | Read-only research through RYO's MCP tools: market_overview, analyze_token, deep_analysis and monitor_market_sentiment_shift in every hearing; scan_market and compare_tokens when a cross-examination needs them. Practice levels only. No trades, no funds. |
| Limitations | Live hearings were blocked at submission: the RYO key's call allowance was exhausted (reported to the organisers). The pipeline is verified by 53 automated tests against a local MCP server. RYO offers no check_safety tool. Reputation scoring and the jury room are not built yet. |

## Tech Stack

| | |
|---|---|
| Frontend Stack | React 19, TypeScript, Vite and React Router. Hosted on Vercel. |
| Backend Stack | Python 3.12, FastAPI, the official MCP Python SDK, SQLite, httpx and Pydantic. Hosted on Render. |
| AI Model(s) | Claude Sonnet 5.5 (claude-sonnet-5-5) through the Anthropic API. The model is set by LLM_MODEL, and OpenAI-compatible endpoints are also supported. |
| Other Technologies | Model Context Protocol over streamable HTTP to RYO's tools; server-sent events for live updates; pytest and ESLint for checks. |

## Repository / Demo

| | |
|---|---|
| Github Repository | https://github.com/Ted1166/crypto-council |
| Demo Video | https://www.youtube.com/watch?v=Tn6a2jO91FU |
| Documentation | README.md (setup, design, configuration) and docs/receipt-schema.md in the repository. Live app: https://crypto-council-pink.vercel.app |

## Testing Information

| | |
|---|---|
| How to run the Project | Run the FastAPI backend and the Vite frontend locally, using the steps below.<br>Open http://localhost:5173 in a browser. |

| | |
|---|---|
| Prerequisites | Python 3.11 or newer (3.12 used), Node 22 or new, a RYO MCP URL and key, and an LLM API key (Anthropic by default). |
| Installa4on Steps | 1) cp.env.example env and fill it in. 2) cd backend; python -m venv venv; .venv/bin/pip install -r requirements.txt 3) cd frontend; npm install |
| Environment Variables | Required: RYO_MCP_URL, RYO_API_TOKEN, LLM_MODEL, LLM_API_KEY. Optional: LLM_PROVIDER, LLM_BASE_URL, RYO_TRANSPORT, RYO_CACHE_TTL_SECONDS, DATABASE_PATH, CORS_ORIGINS, and VITE_API_URL for the frontend. See env.example. |
| Build Command | cd frontend && npm run build |
| Run Command | Backend: cd backend && .venv/bin/uvicorn app.main:app --port 8000. Frontend:<br>cd frontend && npm run dev |
| Test Command | Backend: cd backend && .venv/bin/pip install -r requirements-dev.txt && venv/bin/pytest (53 tests, no keys needed). Frontend: cd frontend && npm run lint |
| Test Account(s) | None needed. There is no login. Tests need no keys; live hearings need the RYO and LLM keys in .env. |
